CC glucagon-like peptide 1 (GLP-1) residues 7-35 by addition, deletion  
CC and/or substitution of one or more amino acid residues. The GLP-1 derived  
CC peptides have an added sequence at the C-terminal of formula Waa-(Xaa)n-  
CC Yaa, where Waa is arginine or lysine; Xaa is arginine or lysine; Yaa is  
CC arginine, arginine amide, lysine, lysine amide or homoserine; and n is 0-  
CC 14. The GLP-1 peptide derivatives have tolerance to dipeptidylpeptidase  
CC IV and to trypsin due to the nature of the substitution. The peptides can  
CC be synthesised by standard solid-state peptide synthesis methods. The  
CC peptides can be used in the treatment of diabetes (insulin-dependent or  
CC insulin non-dependent), obesity and excessive appetite. Sequences

CC -!- FUNCTION: Glucagon plays a key role in glucose metabolism and  
CC homeostasis. Regulates blood glucose by increasing gluconeogenesis  
CC and decreasing glycolysis. A counterregulatory hormone of insulin,  
CC raises plasma glucose levels in response to insulin-induced  
CC hypoglycemia (By similarity).  
CC -!- FUNCTION: GLP-1 is a potent stimulator of glucose-dependent  
CC insulin release. Play important roles on gastric motility and the  
CC suppression of plasma glucagon levels. May be involved in the  
CC suppression of satiety and stimulation of glucose disposal in  
CC peripheral tissues, independent of the actions of insulin. Have  
CC growth-promoting activities on intestinal epithelium. May also  
CC regulate the hypothalamic pituitary axis (HPA) via effects on LH,  
CC TSH, CRH, oxytocin, and vasopressin (By similarity).

CC -!- FUNCTION: GLP-2 stimulates intestinal growth and up-regulates  
CC villus height in the small intestine, concomitant with increased  
CC crypt cell proliferation and decreased enterocyte apoptosis. The  
CC gastrointestinal tract, from the stomach to the colon is the  
CC principal target for GLP-2 action. Plays a key role in nutrient  
CC homeostasis, enhancing nutrient assimilation through enhanced  
CC gastrointestinal function, as well as increasing nutrient  
CC disposal. Stimulates intestinal glucose transport and decreases  
CC mucosal permeability (By similarity).  
CC -!- FUNCTION: Oxyntomodulin significantly reduces food intake (By  
CC similarity).  
CC -!- FUNCTION: Glucagon may modulate gastric acid secretion and  
CC gastro-pyloro-duodenal activity.  
CC -!- SUBCELLULAR LOCATION: Secreted protein.  
CC -!- TISSUE SPECIFICITY: Glucagon is secreted in the A cells of the  
CC islets of Langerhans. GLP-1, GLP-2, oxyntomodulin and glucagonin  
CC are secreted from enteroendocrine cells throughout the  
CC gastrointestinal tract. GLP1 and GLP2 are also secreted in  
CC selected neurons in the brain.  
CC -!- INDUCTION: Glucagon release is stimulated by hypoglycemia and  
CC inhibited by hyperglycemia, insulin, and somatostatin. GLP-1 and  
CC GLP-2 are induced in response to nutrient ingestion (By  
CC similarity).  
CC -!- PTM: Proglucagon is posttranslationally processed in a tissue-  
CC specific manner in pancreatic A cells and intestinal L cells. In  
CC pancreatic A cells, the major bioactive hormone is glucagon  
CC cleaved by PCSK2/PC2. In the intestinal L cells PCSK1/PC1  
CC liberates GLP-1, GLP-2, glucagonin and oxyntomodulin. GLP-1 is  
CC further N-terminally truncated by posttranslational processing in  
CC the intestinal L cells resulting in GLP-1(7-37) GLP-1(7-36)amide.  
CC The C-terminal amidation is neither important for the metabolism  
CC of GLP-1 nor for its effects on the endocrine pancreas (By  
CC similarity).  
CC -!- MISCELLANEOUS: GLP-2 does not have cleavage on a pair of basic  
CC residues at C-terminus as in other mammals.  
CC -!- SIMILARITY: Belongs to the glucagon family.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.
